shrubs, It is abundant from the Sea coast to an altitude of 2500 ft among the mountains, and is largely relied upon for bee food — under the name called honey. It is in blossom during June & July —

321 I am unable to tell you whether Monardella Breweri is an annual.

Will be very glad to have your Flora of Cal, is published,

Euphorbia misera is quite abundant about the granite Boundary Monument on the sea shore, some 15 miles from here,

Arctostaphylos bicolor is common among the mountains some 40 miles from here, Will send you more fruit, when that is from a shrub growing in town — wild —

Will also send more of Audibertia Clevelandii, Clematis pauciflora grows in the valleys about town,

I hope to send the duplicate plants & a few new ones within ten days,

Very truly yours

T. S. Cleveland

San Diego Cal July 16/75

Prof. Asa Gray

Cambridge Mass

Dear Sir, Your list of the plants, accompanying the name of plants sent you May, has been received, for which I thank you very much, & am glad to learn that the last contained so many of interest,

The fruit I sent as of Euphorbia misera 169 is not of that plant, Flower & examination, and I am in doubt if it is of 296 — Argemone Californicum, I sent some of the leaves in this letter, when the plant blooms I will send flowers, — say in March next,

Will send you duplicates of

284 Monardella — 2,

293 Arenaria cauliis Nuttallii,

311 Sedum variegatum, n. sp. —

312 Phoxerma arcuarium,

323 Micrositis Lindleyi — of the others I have no duplicates at present

284 Monardella — ?, is abundant in the Mountains some 40 miles N. E. of San Diego,

288 Dicentra chrysantha, grows near Poway in dry beds of streams, about 25 miles from here,

291 Pentstemon Cordifolius grows in the Mountains N E of here, say 40 miles back —

[illegible] is not [illegible] about ripening its seed, but will try,

294 Mesembryanthemum aciniaeforme grows in the sand along the sea coast close to the water, I have never seen it growing elsewhere, & have no reason to suppose that it is anything but an indigenous growth, I find it 15 miles from Town, far away from any settlement, but have also Mesembryanthemum chrystallinum, which grows almost everywhere in saline soil, which I also suppose is indigenous, these two are all of this Genus that I have seen,

296 Lycium Californicum grows in sandy places, and is abundant, I will procure more for you in the season, [illegible] with fruit, It grows in Town,

301 Lupinus albicaulis is quite abundant from 25 miles from Town in the County, - near Poway, & other places,

305 Encelia perennis, is very abundant here along the sandy beds of stream, some 10 miles & more from Town, as is Encelia digitata, It is now too late for the latter,

308 Pentstemon Clevelandi - with the [illegible] was, brought to me from Cañon Santillas in Lower California, about 25 miles below

the Boundary and 80 miles from San Diego, but I procured only 2 specimens of each, one sent to you & the other retained, This Pentstemon I judge from what is told me grows up about 4 ft high, has flowers of the prevailing color in the Pentstemons you sent you, blossoms in May & June, This specimen was obtained about June 30 1875, This Cañon is very difficult of access, I hope to procure you seeds later in the season, This plant grows at foot of the Mountains,

309 Same locality & time of flowering as 306,

388. Phacelia grandiflora is quite abundant near the Light House on Point Loma San Diego, I will get seeds if I can,

311 - Sedum variegatum, this grows in saline soil near False Bay about 7 miles from Town, among what is called Salt grass,

312 Photinia arenarium, grows about 15 miles from San Diego, at base of hills, on road to Poway, I can send you a good lot of it, Does this belong to Orobanchaceæ?

314 Asclepias eriocarpa grows in the mountains N. E. of San Diego, some 35 to 45 miles, where it is abundant,

315 Rhus laurina is one of our commonest
